To Longbeard

Dears

Dear Sirs, Upon learning about the job posting, the title immediately caught my attention as it deals with subjects that interest me: Artificial Intelligence and the Catholic religion. Interestingly, I am currently developing a personal project, a mobile application aimed at the Catholic public. I hope to be able to detail these aspects in future conversations.

I understand that Brazil, which has the largest number of Catholics in the world, although a people who live their faith, does not possess sufficient technological tools to support their devotion. And as a software developer, building solutions that make people's lives easier is a purpose.

Furthermore, I specialized in AI through some applied courses. When I say applied, I don't mean those courses available on the web that teach you how to use the tools; these courses are hands-on with the code itself, building and understanding the algorithms behind the "intelligence." I have also worked professionally with Artificial Intelligence, although not necessarily with an LLM, but with a supervised chatbot. As for the technologies and frameworks presented in the job description, they are all within my knowledge and expertise, including the PostgreSQL database.

Finally, I am very grateful to be able to build something with a noble purpose. I believe the web is a very fertile ground, but due to a lack of knowledge, people don't extract everything that is possible, or they extract what is not good. A Catholic AI project is truly fascinating and can extract the best information that interested people may want or need.
